The sequences given in AAR40158-63 represent human fibronectin (F) and fibroblast cell growth factor (FGF) fragments which were used the production of fusion polypeptides which are able to stimulate cell adhesion and cell growth. These fusion peptides may be used for anti-aging cosmetics and in wound healing after surgery.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                      CX AARBO776-84 are fibroblast growth factors (FGF) FGF-1 to FGF-9
CC respectively. DNA encoding these fibroblast growth factors can be
CC used to create an FGF/saporin fusion protein. DNA encoding such fusion
CC proteins are useful for targetting saporin (a cytoroxin) to a cell
CC carrying the FGF receptor. Targetted agents (TA) other than saporin
CC which may be used include in partic. DNA encoding a therapeutic protein,
CC designs DNA or other cytoroxic agent. The linker sequence within the
CC fusion protein may increases serum stability or intracellular
CC availability of the TA. The conjugates of the invention are used to
CC inhibit cell proliferation in cells carrying the particular growth
CC factor receptor; also when TA is DNA it can be used to deliver this
CC to cells (for gene therapy). A specific application is to prevent
CC excessive proliferation of epithelial cells, fibroblasts and
CC keratinocytes in the anterior eye after surgery, partic. to prevent
CC recurrence of pterygil after surgical removal, closure of
CC trabeculectomy after glaucoma surgery and corneal clouding after
CC excimen laser treatment. Other conditions which may be treated include
CC tumours, restenosis, psoriasis, Dupytren's contracture, diabetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               psoriasis; rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New conjugates of growth factor receptor ligand and targetted agent - partic. DNA or cytotoxin, used to control cell proliferation in the eye, e.g. to prevent growth of pterygii and corneal clouding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo sapiens

                                                                                                                                                                                                                                                            The present sequence is a human fibronectin amino-terminal oligopeptide, which was used in the development of a novel method for increasing the efficiency of gene introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral diseases, e.g. AIDS.

                                                                                                                                                                                                                                                                                                                        AAW19595 is a biologically active recombinant human basic fibroblast growth factor (bFGF). The protein is free from all infectious impurities, substances that normally accompany it and from post-translational modification of Cys residues of native human bFGF. Recombinant bFGF is used to promote healing of wounds, bone fractures, damaged myocardial tissue etc. and, since it increases neuronal survival and promotes neurite outgrowth, may also be used in treatment of neurological disorders such as Alzheimer's and Parkinson's diseases. bFGF may also be used for detection of specific inhibitors; for treatment of cell cultures in vitro before transplant and for inducing release of tissue plasminogen activator or collagenase, e.g. for treatment of a chronic tendency to form embolism. Recombinant bFGF can be produced on a

The method is for the control of human immunodeficiency virus (HIV) infection using a composition which comprises a functional substance which participates in the infection HIV. The method is used to control HIV-infection.

                                                                                            ફ
                                                                                                                                                                                                                                                    (FGF-2), or basic fibroblast growth factor (bFGF). Claimed DNA (molecules of the invention encode FGF mutein polypeptides (see AAW75711-20) that show reduced FGF receptor binding activity but which retain the ability to bind heparin. For FGF-2, amino acid residues 95, 101 or 104 are preferably replaced by other amino acid residues, with an optional further replacement of the Glu-96 (Cgs-78 and Cys-96 residues to reduce aggregation. The mutein may be further modified by replacement of the Cys-78 and Cys-96 residues to reduce aggregation. The mutein Cis obtained by site-specific or site-directed mutagenesis of FGF-2 DNA, incorporation of the mutated DNA into a vector and expression in host cells. The FGF muteins are used to treat heparin-related disorders, such as excessive bleeding induced by heparin, cophthalmic disorders and heparin-associated thrombosytopenia and thrombosis. They may also be used for drug design, especially

                                                                                                                                        leader sequence. The specification describes a method for inhibitally export of a leaderless protein from a cell. The method comprises treating the cell with an agent that inhibits binding between the leaderless protein and a transport molecule. Treatment with the inhibiting agent is specifically used to treat angiogenesis and restenosis, i.e. where expression of FGF-2 is inhibited, and the agent is applied to endothelial or smooth muscle cells. Other applications are treatment of tumours (melanoma, teratocarcinoma, ovarian carcinoma, bladder cancer and teratocarcinoma, ovarian carcinoma, commolications of

                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the 18 kD isoform of the human fibroblast growth factor 2 (FGF2). The invention relates to inhibiting nuclear localisation of a nuclear protein in a cell, by administering an inhibitor of nuclear trafficking components. Interrupting the interaction of trafficking components and nuclear proteins may be used in a variety of applications, including inhibiting nuclear localisation, modulating protein trafficking of nuclear proteins such as FGF (in vitro or in vivo), identifying further trafficking components, and treating a variety of conditions associated with nuclear trafficking. The 24, 23 and 22 kD isoforms of FGF2 are nuclear proteins whereas the 18 kD isoform is not but is secreted. Inhibiting the nuclear transport of FGF-2 allows the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; fibroblast growth factor; translational start site; isoform; inhibition; nuclear localisation; nuclear trafficking component; proliferation; inflammation; tumour growth; anglogenesis.
                                                                                                                                                                                                                                                                                                                                     of undesired proliferation and inflammation, particularly tumour growth. Increasing export of FGF can promote angiogenesis. In addition, use of inhibitors of nuclear localisation can limit or eradicate viral (e.g. HI

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  seq length: 0

Ü	Description	A; Molecule type: DNA
	,	A;Residues: 1-114 <shi></shi>
132398	basic fibroblast g	A; Note: authors translated the codon GGA for residue 47 as Ala
KBOB		R;Kurokawa, T.; Sasada, R.; Iwane, M.; Igarashi, K.
131674	fibroblast	FEBS Lett. 213, 189-194, 1987
137360	fibroblast	A; Title: Cloning and expression of cDNA encoding human basic fibroblast growth factor.
300185	fibroblast	A; Reference number: A26642; MUID:87162468; PMID:2435575
31622	fibroblast	A;Accession: A26642
148834	basic fibroblast g	A; Molecule type: mRNA
[46711	fibroblast growth	A; Residues: 56-210 <kur></kur>
140117	basic fibroblast g	A; Cross-references: GB:M27968; NID:g182562; PIDN:AAA52448.1; PID:g182563
132484	basic fibroblast g	R; Abraham, J.A.; Whang, J.L.; Tumolo, A.; Mergia, A.; Fiddes, J.C.
160721	acidic fibroblast	Cold Spring Harb. Symp. Quant. Biol. 51, 657-668, 1986
160130		A; Title: Human basic fibroblast growth factor: nucleotide sequence, genomic organization
133665	acidic fibroblast	A;Reference number: A90924; MUID:87217066; PMID:3472745
304147		A;Accession: B32878
037360	acidic fibroblast	A; Molecule type: mRNA
JH0476	acidic fibroblast	BR >
JW0055		A; Note: the authors translated the codon GAA for residue 108 as Gly
3KBOA		R;Abraham, J.A.; Whang, J.L.; Tumolo, A.; Mergia, A.; Friedman, J.; Gospodarowicz, D.; F
150710	fibroblast growth	EMBO J. 5, 2523-2528, 1986
CVHUHS	fibroblast growth	A; Title: Human basic fibroblast growth factor: nucleotide sequence and genomic organizat
JC4627	fibroblast growth	A; Reference number: S00297; MUID:87053817; PMID:3780670
150588	fibroblast growth	A;Accession: S00297
S14192	fibroblast growth	A;Status: not compared with conceptual translation
320102	fibroblast growth	A; Molecule type: DNA
JC4268	fibroblast growth	A; Residues: 1-155 < AB2 >
136207	fibroblast growth	A; Note: the authors translated the codon GAA for residue 108 as Gly
368144	fibroblast growth	R;Shimoyama, Y.; Gotoh, M.; Ino, Y.; Sakamoto, M.; Kato, K.; Hironasni, S.
IVMSHS	fibroblast growth	Jpn. J. Cancer Res. 82, 1263-1270, 1991
523595	embryonic fibrobla	A;Title: Characterization of high-molecular-mass forms of basic fibiobiase growin factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score
